## Chapter 1

# Deprecated List

**Member `TiXmlHandle::Element()` `const`** use `ToElement`. Return the handle as a `TiXmlElement`. This may return null.

**Member `TiXmlHandle::Node()` `const`** use `ToNode`. Return the handle as a `TiXmlNode`. This may return null.

**Member `TiXmlHandle::Text()` `const`** use `ToText()` Return the handle as a `TiXmlText`. This may return null.

**Member `TiXmlHandle::Unknown()` `const`** use `ToUnknown()` Return the handle as a `TiXmlUnknown`. This may return null.

## Chapter 2

# Class Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Area . . . . .	7
AreaCommand . . . . .	8
Item . . . . .	8
ItemCommand . . . . .	9
StateDescriptor . . . . .	10
TiXmlAttributeSet . . . . .	12
TiXmlBase . . . . .	13
TiXmlAttribute . . . . .	10
TiXmlNode . . . . .	32
TiXmlComment . . . . .	18
TiXmlDeclaration . . . . .	19
TiXmlDocument . . . . .	21
TiXmlElement . . . . .	25
TiXmlText . . . . .	43
TiXmlUnknown . . . . .	44
TiXmlCursor . . . . .	19
TiXmlHandle . . . . .	29
TiXmlParsingData . . . . .	39
TiXmlString . . . . .	41
TiXmlOutputStream . . . . .	39
TiXmlVisitor . . . . .	46
TiXmlPrinter . . . . .	39
World . . . . .	47

## Chapter 3

# Class Index

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Area</a>	7

<a href="#">TiXmlUnknown</a>	44
<a href="#">TiXmlVisitor</a>	46
<a href="#">World</a>	47

## Chapter 4

# Class Documentation

### 4.1 Area Class Reference

#### Public Member Functions

- bool **has\_description** (std::string desc\_id)
- std::string **get\_status** ()
- bool **has\_current\_desc** ()
- int **get\_num\_items** ()
- std::string **get\_description** ()
- void **remove\_item** (int index)
- void **add\_item** (Item \*new\_item)
- Item \* **get\_item** (int index)
- std::string **get\_id** ()
- bool **has\_item** (std::string item\_to\_find)
- Item \* **get\_item** (std::string item\_id)
- void **add\_description** (StateDescriptor \*desc)
- void **add\_command** (AreaCommand \*command\_name)
- int **get\_num\_commands** ()
- AreaCommand \* **get\_command** (int index)
- AreaCommand \* **has\_command** (std::string command\_name)
- int **get\_num\_descriptions** ()
- StateDescriptor \* **get\_descriptor** (int index)
- Area (const char \*id, const char \*desc\_id, const char \*status)

#### Protected Attributes

- std::vector< Item \* > **items**
- int **num\_items**
- int **num\_descriptions**
- int **num\_commands**

- `std::string` **status**
- `std::string` **id**
- `std::string` **curr\_desc\_id**
- `std::vector< StateDescriptor * >` **description**
- `std::vector< AreaCommand * >` **commands**

The documentation for this class was generated from the following file:

- `/home/cshome/m/mabrams/345/txtEngine/Area.h`

## 4.2 AreaCommand Class Reference

### Public Member Functions

- **AreaCommand** (`const char *callmeby`, `const char *areatomoveto`, `const char *status_command`, `const char *depends_command`)
- `std::string` **get\_depends** ()
- `std::string` **get\_status** ()
- `std::string` **get\_name** ()
- `std::string` **get\_area** ()
- `std::string` **get\_message** ()
- `void` **set\_message** (`const char *to_message`)
- `bool` **find** (`std::string to_find`)

### Protected Attributes

- `std::string` **name**
- `std::string` **status**
- `std::string` **message**
- `std::string` **depends**
- `std::string` **move\_to\_area**

The documentation for this class was generated from the following file:

- `/home/cshome/m/mabrams/345/txtEngine/AreaCommand.h`

## 4.3 Item Class Reference

### Public Member Functions

- `bool` **has\_description** (`std::string desc_id`)
- `bool` **has\_current\_desc** ()
- `std::string` **get\_description** ()

- void **add\_description** ([StateDescriptor](#) \*desc)
- void **change\_collectable** (bool flip)
- bool **is\_collectable** ()
- std::string **get\_id** ()
- int **get\_num\_commands** ()
- void **add\_command** ([ItemCommand](#) \*command\_name)
- [ItemCommand](#) \* **get\_command** (int index)
- [ItemCommand](#) \* **has\_command** (std::string command\_name)
- int **get\_num\_descriptions** ()
- [StateDescriptor](#) \* **get\_descriptor** (int index)
- void **state\_change** (std::string to\_change)
- **Item** (bool collect, const char \*identifier, const char \*initial\_state)

### Protected Attributes

- bool **collectable**
- int **num\_descriptions**
- int **num\_commands**
- std::string **id**
- std::string **curr\_desc\_id**
- std::vector< [StateDescriptor](#) \* > **description**
- std::vector< [ItemCommand](#) \* > **commands**

The documentation for this class was generated from the following file:

- /home/cshome/m/mabrams/345/txtEngine/Item.h

## 4.4 ItemCommand Class Reference

### Public Member Functions

- **ItemCommand** (const char \*callmeby, const char \*state\_mutator, bool chng\_collec, bool collec\_dep, const char \*area\_chng, const char \*status\_command, const char \*depends)
- std::string **get\_depends** ()
- bool **get\_change\_collect** ()
- bool **get\_collect\_dependent** ()
- std::string **get\_area\_change** ()
- std::string **get\_status** ()
- std::string **get\_message** ()
- std::string **get\_name** ()
- std::string **get\_state\_change** ()
- void **set\_message** (const char \*to\_message)

### Protected Attributes

- std::string **name**
- std::string **state\_change**
- std::string **message**
- std::string **area\_change**
- std::string **depends**
- std::string **status**
- bool **change\_collect**
- bool **collect\_dependent**

The documentation for this class was generated from the following file:

- /home/cshome/m/mabrams/345/txtEngine/ItemCommand.h

## 4.5 StateDescriptor Class Reference

### Public Member Functions

- **StateDescriptor** (const char \*identifier)
- void **set\_description** (const char \*desc)
- std::string **get\_id** ()
- std::string **get\_description** ()

### Protected Attributes

- std::string **id**
- std::string **description**

The documentation for this class was generated from the following file:

- /home/cshome/m/mabrams/345/txtEngine/StateDescriptor.h

## 4.6 TiXmlAttribute Class Reference

```
#include <tinyxml.h>
```

Inheritance diagram for TiXmlAttribute:

## Public Member Functions

- [TiXmlAttribute](#) ()  
*Construct an empty attribute.*
- [TiXmlAttribute](#) (const char \*\_name, const char \*\_value)  
*Construct an attribute with a name and value.*
- const char \* [Name](#) () const  
*Return the name of this attribute.*
- const char \* [Value](#) () const  
*Return the value of this attribute.*
- int [IntValue](#) () const  
*Return the value of this attribute, converted to an integer.*
- double [DoubleValue](#) () const  
*Return the value of this attribute, converted to a double.*
- const TIXML\_STRING & [NameTStr](#) () const
- int [QueryIntValue](#) (int \*\_value) const
- int [QueryDoubleValue](#) (double \*\_value) const  
*QueryDoubleValue examines the value string. See [QueryIntValue\(\)](#).*
- void [SetName](#) (const char \*\_name)  
*Set the name of this attribute.*
- void [SetValue](#) (const char \*\_value)  
*Set the value.*
- void [SetIntValue](#) (int \_value)  
*Set the value from an integer.*
- void [SetDoubleValue](#) (double \_value)  
*Set the value from a double.*
- const [TiXmlAttribute](#) \* [Next](#) () const  
*Get the next sibling attribute in the DOM. Returns null at end.*
- [TiXmlAttribute](#) \* [Next](#) ()
- const [TiXmlAttribute](#) \* [Previous](#) () const  
*Get the previous sibling attribute in the DOM. Returns null at beginning.*
- [TiXmlAttribute](#) \* [Previous](#) ()
- bool **operator==** (const [TiXmlAttribute](#) &rhs) const
- bool **operator<** (const [TiXmlAttribute](#) &rhs) const
- bool **operator>** (const [TiXmlAttribute](#) &rhs) const
- virtual const char \* **Parse** (const char \*p, [TiXmlParsingData](#) \*data, TiXmlEncoding encoding)
- virtual void [Print](#) (FILE \*cf, int depth) const
- void **Print** (FILE \*cf, int depth, TIXML\_STRING \*str) const
- void **SetDocument** ([TiXmlDocument](#) \*doc)

## Friends

- class [TiXmlAttributeSet](#)

### 4.6.1 Detailed Description

An attribute is a name-value pair. Elements have an arbitrary number of attributes, each with a unique name.

#### Note

The attributes are not `TiXmlNode`s, since they are not part of the tinyXML document object model. There are other suggested ways to look at this problem.

### 4.6.2 Member Function Documentation

**4.6.2.1** `virtual void TiXmlAttribute::Print ( FILE * cfile, int depth ) const` [`inline`, `virtual`]

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, `std::string` in STL mode.) Either or both `cfile` and `str` can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implements [TiXmlBase](#).

**4.6.2.2** `int TiXmlAttribute::QueryIntValue ( int * _value ) const`

`QueryIntValue` examines the value string. It is an alternative to the [IntValue\(\)](#) method with richer error checking. If the value is an integer, it is stored in 'value' and the call returns `TIXML_SUCCESS`. If it is not an integer, it returns `TIXML_WRONG_TYPE`.

A specialized but useful call. Note that for success it returns 0, which is the opposite of almost all other TinyXml calls.

The documentation for this class was generated from the following files:

- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.h`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxmlparser.cpp`

## 4.7 TiXmlAttributeSet Class Reference

### Public Member Functions

- void **Add** ([TiXmlAttribute](#) \*attribute)
- void **Remove** ([TiXmlAttribute](#) \*attribute)
- const [TiXmlAttribute](#) \* **First** () const
- [TiXmlAttribute](#) \* **First** ()
- const [TiXmlAttribute](#) \* **Last** () const
- [TiXmlAttribute](#) \* **Last** ()

- [TiXmlAttribute](#) \* **Find** (const char \*\_name) const
- [TiXmlAttribute](#) \* **FindOrCreate** (const char \*\_name)

The documentation for this class was generated from the following files:

- /home/cshome/m/mabrams/345/txtEngine/tinyxml.h
- /home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp

## 4.8 TiXmlBase Class Reference

```
#include <tinyxml.h>
```

Inheritance diagram for TiXmlBase:

### Classes

- struct **Entity**

### Public Types

- enum {  
**TIXML\_NO\_ERROR** = 0, **TIXML\_ERROR**, **TIXML\_ERROR\_OPENING\_FILE**, **TIXML\_ERROR\_PARSING\_ELEMENT**,  
**TIXML\_ERROR\_FAILED\_TO\_READ\_ELEMENT\_NAME**, **TIXML\_ERROR\_READING\_ELEMENT\_VALUE**, **TIXML\_ERROR\_READING\_ATTRIBUTES**, **TIXML\_ERROR\_PARSING\_EMPTY**,  
**TIXML\_ERROR\_READING\_END\_TAG**, **TIXML\_ERROR\_PARSING\_UNKNOWN**, **TIXML\_ERROR\_PARSING\_COMMENT**, **TIXML\_ERROR\_PARSING\_DECLARATION**,  
**TIXML\_ERROR\_DOCUMENT\_EMPTY**, **TIXML\_ERROR\_EMBEDDED\_NULL**, **TIXML\_ERROR\_PARSING\_CDATA**, **TIXML\_ERROR\_DOCUMENT\_TOP\_ONLY**,  
**TIXML\_ERROR\_STRING\_COUNT** }

### Public Member Functions

- virtual void [Print](#) (FILE \*cfile, int depth) const =0
- int [Row](#) () const

- int [Column](#) () const  
*See [Row\(\)](#)*
- void [SetUserData](#) (void \*user)  
*Set a pointer to arbitrary user data.*
- void \* [GetUserData](#) ()  
*Get a pointer to arbitrary user data.*
- const void \* [GetUserData](#) () const  
*Get a pointer to arbitrary user data.*
- virtual const char \* **Parse** (const char \*p, [TiXmlParsingData](#) \*data, TiXmlEncoding encoding)=0

### Static Public Member Functions

- static void [SetCondenseWhiteSpace](#) (bool condense)
- static bool [IsWhiteSpaceCondensed](#) ()  
*Return the current white space setting.*
- static void [EncodeString](#) (const TIXML\_STRING &str, TIXML\_STRING \*out)

### Static Public Attributes

- static const int **utf8ByteTable** [256]

### Static Protected Member Functions

- static const char \* **SkipWhiteSpace** (const char \*, TiXmlEncoding encoding)
- static bool **IsWhiteSpace** (char c)
- static bool **IsWhiteSpace** (int c)
- static const char \* **ReadName** (const char \*p, TIXML\_STRING \*name, TiXmlEncoding encoding)
- static const char \* **ReadText** (const char \*in, TIXML\_STRING \*text, bool ignoreWhiteSpace, const char \*endTag, bool ignoreCase, TiXmlEncoding encoding)
- static const char \* **GetEntity** (const char \*in, char \*value, int \*length, TiXmlEncoding encoding)
- static const char \* **GetChar** (const char \*p, char \*\_value, int \*length, TiXmlEncoding encoding)
- static bool **StringEqual** (const char \*p, const char \*endTag, bool ignoreCase, TiXmlEncoding encoding)
- static int **IsAlpha** (unsigned char anyByte, TiXmlEncoding encoding)
- static int **IsAlphaNum** (unsigned char anyByte, TiXmlEncoding encoding)
- static int **ToLower** (int v, TiXmlEncoding encoding)
- static void **ConvertUTF32ToUTF8** (unsigned long input, char \*output, int \*length)

## Protected Attributes

- [TiXmlCursor](#) **location**
- void \* [userData](#)

*Field containing a generic user pointer.*

## Static Protected Attributes

- static const char \* **errorString** [TIXML\_ERROR\_STRING\_COUNT]

## Friends

- class [TiXmlNode](#)
- class [TiXmlElement](#)
- class [TiXmlDocument](#)

### 4.8.1 Detailed Description

[TiXmlBase](#) is a base class for every class in TinyXml. It does little except to establish that TinyXml classes can be printed and provide some utility functions.

In XML, the document and elements can contain other elements and other types of nodes.

```
A Document can contain: Element (container or leaf)
Comment (leaf)
Unknown (leaf)
Declaration( leaf )
```

```
An Element can contain: Element (container or leaf)
Text (leaf)
Attributes (not on tree)
Comment (leaf)
Unknown (leaf)
```

```
A Declaration contains: Attributes (not on tree)
```

### 4.8.2 Member Function Documentation

#### 4.8.2.1 void TiXmlBase::EncodeString ( const TIXML\_STRING & *str*, TIXML\_STRING \* *out* ) [static]

Expands entities in a string. Note this should not contain the tag's '<', '>', etc, or they will be transformed into entities!

**4.8.2.2** `virtual void TiXmlBase::Print ( FILE * cfile, int depth ) const` `[pure virtual]`

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, `std::string` in STL mode.) Either or both *cfile* and *str* can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implemented in [TiXmlAttribute](#), [TiXmlElement](#), [TiXmlComment](#), [TiXmlText](#), [TiXmlDeclaration](#), [TiXmlUnknown](#), and [TiXmlDocument](#).

**4.8.2.3** `int TiXmlBase::Row ( ) const` `[inline]`

Return the position, in the original source file, of this node or attribute. The row and column are 1-based. (That is the first row and first column is 1,1). If the returns values are 0 or less, then the parser does not have a row and column value.

Generally, the row and column value will be set when the `TiXmlDocument::Load()`, [TiXmlDocument::LoadFile\(\)](#), or any `TiXmlNode::Parse()` is called. It will NOT be set when the DOM was created from operator`>>`.

The values reflect the initial load. Once the DOM is modified programmatically (by adding or changing nodes and attributes) the new values will NOT update to reflect changes in the document.

There is a minor performance cost to computing the row and column. Computation can be disabled if [TiXmlDocument::SetTabSize\(\)](#) is called with 0 as the value.

#### See also

[TiXmlDocument::SetTabSize\(\)](#)

**4.8.2.4** `static void TiXmlBase::SetCondenseWhiteSpace ( bool condense )` `[inline, static]`

The world does not agree on whether white space should be kept or not. In order to make everyone happy, these global, static functions are provided to set whether or not TinyXml will condense all white space into a single space or not. The default is to condense. Note changing this value is not thread safe.

### 4.8.3 Member Data Documentation

**4.8.3.1** `const char * TiXmlBase::errorString` `[static, protected]`

#### Initial value:

```
{
    "No error",
    "Error",
    "Failed to open file",
```

- /home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp
- /home/cshome/m/mabrams/345/txtEngine/tinyxmlerror.cpp
- /home/cshome/m/mabrams/345/txtEngine/tinyxmlparser.cpp

## 4.9 TiXmlComment Class Reference

```
#include <tinyxml.h>
```

Inheritance diagram for TiXmlComment:

### Public Member Functions

- [TiXmlComment](#) ()  
*Constructs an empty comment.*
- [TiXmlComment](#) (const char \* \_value)

#### 4.9.1 Detailed Description

An XML comment.

## 4.9.2 Member Function Documentation

4.9.2.1 `bool TiXmlComment::Accept ( TiXmlVisitor * visitor ) const` `[virtual]`

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

4.9.2.2 `void TiXmlComment::Print ( FILE * cfile, int depth ) const` `[virtual]`

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, `std::string` in STL mode.) Either or both `cfile` and `str` can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implements [TiXmlBase](#).

The documentation for this class was generated from the following files:

- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.h`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxmlparser.cpp`

### 4.11.1 Detailed Description

In correct XML the declaration is the first entry in the file.

```
<?xml version="1.0" standalone="yes"?>
```

TinyXml will happily read or write files without a declaration, however. There are 3 possible attributes to the declaration: version, encoding, and standalone.

Note: In this version of the code, the attributes are handled as special cases, not generic attributes, simply because there can only be at most 3 and they are always the same.

### 4.11.2 Member Function Documentation

**4.11.2.1** `bool TiXmlDeclaration::Accept ( TiXmlVisitor * visitor ) const` [virtual]

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

**4.11.2.2** `virtual void TiXmlDeclaration::Print ( FILE * cfile, int depth ) const` [inline, virtual]

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, `std::string` in STL mode.) Either or both *cfile* and *str* can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implements [TiXmlBase](#).

The documentation for this class was generated from the following files:

- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.h`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp`

*Cast to a more defined type. Will return null not of the requested type.*
- virtual [TiXmlDocument](#) \* **ToDocument** ()  
*Cast to a more defined type. Will return null not of the requested type.*
- virtual bool **Accept** ([TiXmlVisitor](#) \*content) const

### Protected Member Functions

- virtual [TiXmlNode](#) \* **Clone** () const

#### 4.12.1 Detailed Description

Always the top level node. A document binds together all the XML pieces. It can be saved, loaded, and printed to the screen. The 'value' of a document node is the xml file name.

#### 4.12.2 Member Function Documentation

**4.12.2.1** bool [TiXmlDocument::Accept](#) ( [TiXmlVisitor](#) \* *content* ) const [virtual]

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

**4.12.2.2** void [TiXmlDocument::ClearError](#) ( ) [inline]

If you have handled the error, it can be reset with this call. The error state is automatically cleared if you Parse a new XML block.

**4.12.2.3** [TiXmlNode](#) \* [TiXmlDocument::Clone](#) ( ) const [protected, virtual]

Create an exact duplicate of this node and return it. The memory must be deleted by the caller.

Implements [TiXmlNode](#).

**4.12.2.4** bool [TiXmlDocument::Error](#) ( ) const [inline]

If an error occurs, Error will be set to true. Also,

- The [ErrorId\(\)](#) will contain the integer identifier of the error (not generally useful)

- The [ErrorDesc\(\)](#) method will return the name of the error. (very useful)
- The [ErrorRow\(\)](#) and [ErrorCol\(\)](#) will return the location of the error (if known)

#### 4.12.2.5 `int TiXmlDocument::ErrorId ( ) const [inline]`

Generally, you probably want the error string ( [ErrorDesc\(\)](#) ). But if you prefer the `ErrorId`, this function will fetch it.

#### 4.12.2.6 `int TiXmlDocument::ErrorRow ( ) const [inline]`

Returns the location (if known) of the error. The first column is column 1, and the first row is row 1. A value of 0 means the row and column wasn't applicable (memory errors, for example, have no row/column) or the parser lost the error. (An error in the error reporting, in that case.)

#### See also

[SetTabSize](#), [Row](#), [Column](#)

#### 4.12.2.7 `bool TiXmlDocument::LoadFile ( TiXmlEncoding encoding = TIXML_DEFAULT_ENCODING )`

Load a file using the current document value. Returns true if successful. Will delete any existing document data before loading.

#### 4.12.2.8 `bool TiXmlDocument::LoadFile ( FILE * file, TiXmlEncoding encoding = TIXML_DEFAULT_ENCODING )`

Load a file using the given `FILE*`. Returns true if successful. Note that this method doesn't stream - the entire object pointed at by the `FILE*` will be interpreted as an XML file. TinyXML doesn't stream in XML from the current file location. Streaming may be added in the future.

#### 4.12.2.9 `const char * TiXmlDocument::Parse ( const char * p, TiXmlParsingData * data = 0, TiXmlEncoding encoding = TIXML_DEFAULT_ENCODING ) [virtual]`

Parse the given null terminated block of xml data. Passing in an encoding to this method (either `TIXML_ENCODING_LEGACY` or `TIXML_ENCODING_UTF8` will force TinyXml to use that encoding, regardless of what TinyXml might otherwise try to detect.

Implements [TiXmlBase](#).

#### 4.12.2.10 `void TiXmlDocument::Print ( ) const [inline]`

Write the document to standard out using formatted printing ("pretty print").

4.12.2.11 `const TiXmlElement* TiXmlDocument::RootElement ( ) const` `[inline]`

Get the root element -- the only top level element -- of the document. In well formed XML, there should only be one. TinyXml is tolerant of multiple elements at the document level.

4.12.2.12 `void TiXmlDocument::SetTabSize ( int tabsize )` `[inline]`

`SetTabSize()` allows the error reporting functions (`ErrorRow()` and `ErrorCol()`) to report the correct values for row and column. It does not change the output or input in any way.

By calling this method, with a tab size greater than 0, the row and column of each node and attribute is stored when the file is loaded. Very useful for tracking the DOM back in to the source file.

The tab size is required for calculating the location of nodes. If not set, the default of 4 is used. The tabsize is set per document. Setting the tabsize to 0 disables row/column tracking.

Note that row and column tracking is not supported when using operator<>.

The tab size needs to be enabled before the parse or load. Correct usage:

```
TiXmlDocument doc;
doc.SetTabSize( 8 );
doc.Load( "myfile.xml" );
```

### 4.13.1 Detailed Description

The element is a container class. It has a value, the element name, and can contain other elements, text, comments, and unknowns. Elements also contain an arbitrary number of attributes.

### 4.13.2 Member Function Documentation

**4.13.2.1** `bool TiXmlElement::Accept ( TiXmlVisitor * visitor ) const` [virtual]

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

**4.13.2.2** `const char * TiXmlElement::Attribute ( const char * name, double * d ) const`

Given an attribute name, [Attribute\(\)](#) returns the value for the attribute of that name, or null if none exists. If the attribute exists and can be converted to a double, the double value will be put in the return 'd', if 'd' is non-null.

**4.13.2.3** `const char * TiXmlElement::Attribute ( const char * name ) const`

Given an attribute name, [Attribute\(\)](#) returns the value for the attribute of that name, or null if none exists.

**4.13.2.4** `const char * TiXmlElement::Attribute ( const char * name, int * i ) const`

Given an attribute name, [Attribute\(\)](#) returns the value for the attribute of that name, or null if none exists. If the attribute exists and can be converted to an integer, the integer value will be put in the return 'i', if 'i' is non-null.

**4.13.2.5** `const char * TiXmlElement::GetText ( ) const`

Convenience function for easy access to the text inside an element. Although easy and concise, [GetText\(\)](#) is limited compared to getting the [TiXmlText](#) child and accessing it directly.

If the first child of 'this' is a [TiXmlText](#), the [GetText\(\)](#) returns the character string of the Text node, else null is returned.

This is a convenient method for getting the text of simple contained text:

```
<foo>This is text</foo>
const char* str = fooElement->GetText();
```

'str' will be a pointer to "This is text".

Note that this function can be misleading. If the element foo was created from this XML:

```
<foo><b>This is text</b></foo>
```

then the value of `str` would be null. The first child node isn't a text node, it is another element. From this XML:

```
<foo>This is <b>text</b></foo>
```

`GetText()` will return "This is ".

WARNING: `GetText()` accesses a child node - don't become confused with the similarly named `TiXmlNode::Text()` and `TiXmlNode::ToText()` which are safe type casts on the referenced node.

#### 4.13.2.6 void TiXmlElement::Print ( FILE \* *cfile*, int *depth* ) const [virtual]

All TinyXml classes can print themselves to a filestream or the string class (`TiXmlString` in non-STL mode, `std::string` in STL mode.) Either or both `cfile` and `str` can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implements `TiXmlBase`.

#### 4.13.2.7 int TiXmlElement::QueryBoolAttribute ( const char \* *name*, bool \* *\_value* ) const

`QueryBoolAttribute` examines the attribute - see `QueryIntAttribute()`. Note that '1', 'true', or 'yes' are considered true, while '0', 'false' and 'no' are considered false.

#### 4.13.2.8 int TiXmlElement::QueryIntAttribute ( const char \* *name*, int \* *\_value* ) const

`QueryIntAttribute` examines the attribute - it is an alternative to the `Attribute()` method with richer error checking. If the attribute is an integer, it is stored in '`value`' and the call returns `TIXML_SUCCESS`. If it is not an integer, it returns `TIXML_WRONG_TYPE`. If the attribute does not exist, then `TIXML_NO_ATTRIBUTE` is returned.

#### 4.13.2.9 void TiXmlElement::RemoveAttribute ( const char \* *name* )

Deletes an attribute with the given name.

#### 4.13.2.10 void TiXmlElement::SetAttribute ( const char \* *name*, const char \* *\_value* )

Sets an attribute of name to a given value. The attribute will be created if it does not exist, or changed if it does.

4.13.2.11 void TiXmlElement::SetAttribute ( const char \* *name*, int *value* )

Sets an attribute of name to a given value. The attribute will be created if it does not exist, or changed if it does.

4.13.2.12 void TiXmlElement::SetDoubleAttribute ( const char \* *name*, double *value* )

Sets an attribute of name to a given value. The attribute will be created if it does not exist, or changed if it does.

- [TiXmlElement](#) \* [Element](#) () const
- [TiXmlText](#) \* [Text](#) () const
- [TiXmlUnknown](#) \* [Unknown](#) () const

#### 4.14.1 Detailed Description

A [TiXmlHandle](#) is a class that wraps a node pointer with null checks; this is an incredibly useful thing. Note that [TiXmlHandle](#) is not part of the TinyXml DOM structure. It is a separate utility class.

Take an example:

```
<Document>
<Element attributeA = "valueA">
<Child attributeB = "value1" />
<Child attributeB = "value2" />
</Element>
</Document>
```

Assuming you want the value of "attributeB" in the 2nd "Child" element, it's very easy to write a *lot* of code that looks like:

```
TiXmlElement* root = document.FirstChildElement( "Document" );
if ( root )
{
    TiXmlElement* element = root->FirstChildElement( "Element" );
    if ( element )
    {
        TiXmlElement* child = element->FirstChildElement( "Child" );
        if ( child )
        {
            TiXmlElement* child2 = child->NextSiblingElement( "Child" );
            if ( child2 )
            {
                // Finally do something useful.
            }
        }
    }
}
```

And that doesn't even cover "else" cases. [TiXmlHandle](#) addresses the verbosity of such code. A [TiXmlHandle](#) checks for null pointers so it is perfectly safe and correct to use:

```
TiXmlHandle docHandle( &document );
TiXmlElement* child2 = docHandle.FirstChild( "Document" ).FirstChild( "Element" ).Child( "Child" );
if ( child2 )
{
    // do something useful
}
```

Which is MUCH more concise and useful.

It is also safe to copy handles - internally they are nothing more than node pointers.

```
TiXmlHandle handleCopy = handle;
```

What they should not be used for is iteration:

```

int i=0;
while ( true )
{
    TiXmlElement* child = docHandle.FirstChild( "Document" ).FirstChild( "Element" ).Child( "Child", i ).ToElement();
    if ( !child )
        break;
    // do something
    ++i;
}

```

It seems reasonable, but it is in fact two embedded while loops. The Child method is a linear walk to find the element, so this code would iterate much more than it needs to. Instead, prefer:

```

TiXmlElement* child = docHandle.FirstChild( "Document" ).FirstChild( "Element" ).FirstChild( "Child" ).ToElement();

for( child; child; child=child->NextSiblingElement() )
{
    // do something
}

```

#### 4.14.2 Member Function Documentation

##### 4.14.2.1 TiXmlHandle TiXmlHandle::Child ( const char \* *value*, int *index* ) const

Return a handle to the "index" child with the given name. The first child is 0, the second 1, etc.

##### 4.14.2.2 TiXmlHandle TiXmlHandle::Child ( int *index* ) const

Return a handle to the "index" child. The first child is 0, the second 1, etc.

##### 4.14.2.3 TiXmlElement\* TiXmlHandle::ChildElement ( const char \* *value*, int *index* ) const

Return a handle to the "index" child element with the given name. The first child element is 0, the second 1, etc. Note that only TiXmlElements are indexed: other types are not counted.

##### 4.14.2.4 TiXmlElement\* TiXmlHandle::ChildElement ( int *index* ) const

Return a handle to the "index" child element. The first child element is 0, the second 1, etc. Note that only TiXmlElements are indexed: other types are not counted.

##### 4.14.2.5 TiXmlElement\* TiXmlHandle::Element ( ) const [inline]

#### Deprecated

use ToElement. Return the handle as a [TiXmlElement](#). This may return null.

4.14.2.6 `TiXmlNode* TiXmlHandle::Node ( ) const` `[inline]`

#### Deprecated

use `ToNode`. Return the handle as a [TiXmlNode](#). This may return null.

4.14.2.7 `TiXmlText* TiXmlHandle::Text ( ) const` `[inline]`

#### Deprecated

use `ToText()` Return the handle as a [TiXmlText](#). This may return null.

4.14.2.8 `TiXmlElement* TiXmlHandle::ToElement ( ) const` `[inline]`

Return the handle as a [TiXmlElement](#). This may return null.

4.14.2.9 `TiXmlNode* TiXmlHandle::ToNode ( ) const` `[inline]`

Return the handle as a [TiXmlNode](#). This may return null.

4.14.2.10 `TiXmlText* TiXmlHandle::ToText ( ) const` `[inline]`

Return the handle as a [TiXmlText](#). This may return null.

4.14.2.11 `TiXmlUnknown* TiXmlHandle::ToUnknown ( ) const` `[inline]`

Return the handle as a [TiXmlUnknown](#). This may return null.

4.14.2.12 `TiXmlUnknown* TiXmlHandle::Unknown ( ) const` `[inline]`

#### Deprecated

use `ToUnknown()` Return the handle as a [TiXmlUnknown](#). This may return null.

### Friends

- class [TiXmlNodeDocument](#)
- class [TiXmlNodeElement](#)

#### 4.15.1 Detailed Description

The parent class for everything in the Document Object Model. (Except for attributes). Nodes have siblings, a parent, and children. A node can be in a document, or stand on its own. The type of a [TiXmlNode](#) can be queried, and it can be cast to its more defined type.

## 4.15.2 Member Enumeration Documentation

### 4.15.2.1 enum TiXmlNode::NodeType

The types of XML nodes supported by TinyXml. (All the unsupported types are picked up by UNKNOWN.)

## 4.15.3 Member Function Documentation

### 4.15.3.1 virtual bool TiXmlNode::Accept ( TiXmlVisitor \* visitor ) const [pure virtual]

Accept a hierarchical visit the nodes in the TinyXML DOM. Every node in the XML tree will be conditionally visited and the host will be called back via the [TiXmlVisitor](#) interface.

This is essentially a SAX interface for TinyXML. (Note however it doesn't re-parse the XML for the callbacks, so the performance of TinyXML is unchanged by using this interface versus any other.)

The interface has been based on ideas from:

- <http://www.saxproject.org/>
- <http://c2.com/cgi/wiki?HierarchicalVisitorPattern>

Which are both good references for "visiting".

An example of using [Accept\(\)](#):

```
TiXmlPrinter printer;
tinyxmlDoc.Accept( &printer );
const char* xmlcstr = printer.CStr();
```

Implemented in [TiXmlElement](#), [TiXmlComment](#), [TiXmlText](#), [TiXmlDeclaration](#), [TiXmlUnknown](#), and [TiXmlDocument](#).

### 4.15.3.2 virtual TiXmlNode\* TiXmlNode::Clone ( ) const [pure virtual]

Create an exact duplicate of this node and return it. The memory must be deleted by the caller.

Implemented in [TiXmlElement](#), [TiXmlComment](#), [TiXmlText](#), [TiXmlDeclaration](#), [TiXmlUnknown](#), and [TiXmlDocument](#).

### 4.15.3.3 const TiXmlNode \* TiXmlNode::FirstChild ( const char \* value ) const

The first child of this node with the matching 'value'. Will be null if none found.

**4.15.3.4** `const TiXmlDocument * TiXmlNode::GetDocument ( ) const`

Return a pointer to the Document this node lives in. Returns null if not in a document.

**4.15.3.5** `TiXmlNode * TiXmlNode::InsertAfterChild ( TiXmlNode * afterThis, const TiXmlNode & addThis )`

Add a new node related to this. Adds a child after the specified child. Returns a pointer to the new object or NULL if an error occurred.

**4.15.3.6** `TiXmlNode * TiXmlNode::InsertBeforeChild ( TiXmlNode * beforeThis, const TiXmlNode & addThis )`

Add a new node related to this. Adds a child before the specified child. Returns a pointer to the new object or NULL if an error occurred.

**4.15.3.7** `TiXmlNode * TiXmlNode::InsertEndChild ( const TiXmlNode & addThis )`

Add a new node related to this. Adds a child past the LastChild. Returns a pointer to the new object or NULL if an error occurred.

**4.15.3.8** `const TiXmlNode * TiXmlNode::IterateChildren ( const TiXmlNode * previous ) const`

An alternate way to walk the children of a node. One way to iterate over nodes is:

```
for( child = parent->FirstChild(); child; child = child->NextSibling() )
```

IterateChildren does the same thing with the syntax:

```
child = 0;  
while( child = parent->IterateChildren( child ) )
```

IterateChildren takes the previous child as input and finds the next one. If the previous child is null, it returns the first. IterateChildren will return null when done.

**4.15.3.9** `TiXmlNode * TiXmlNode::LinkEndChild ( TiXmlNode * addThis )`

Add a new node related to this. Adds a child past the LastChild.

NOTE: the node to be added is passed by pointer, and will be henceforth owned (and deleted) by tinyXml. This method is efficient and avoids an extra copy, but should be used with care as it uses a different memory model than the other insert functions.

**See also**

[InsertEndChild](#)

**4.15.3.10** `const TiXmlElement * TiXmlNode::NextSiblingElement ( const char * _value ) const`

Convenience function to get through elements. Calls NextSibling and ToElement. Will skip all non-Element nodes. Returns 0 if there is not another element.

**4.15.3.11** `const TiXmlElement * TiXmlNode::NextSiblingElement ( ) const`

Convenience function to get through elements. Calls NextSibling and ToElement. Will skip all non-Element nodes. Returns 0 if there is not another element.

**4.15.3.12** `TiXmlNode * TiXmlNode::ReplaceChild ( TiXmlNode * replaceThis, const TiXmlNode & withThis )`

Replace a child of this node. Returns a pointer to the new object or NULL if an error occurred.

**4.15.3.13** `void TiXmlNode::SetValue ( const char * _value ) [inline]`

Changes the value of the node. Defined as:

```
Document: filename of the xml file
Element: name of the element
Comment: the comment text
Unknown: the tag contents
Text: the text string
```

**4.15.3.14** `int TiXmlNode::Type ( ) const [inline]`

Query the type (as an enumerated value, above) of this node. The possible types are: TINYXML\_DOCUMENT, TINYXML\_ELEMENT, TINYXML\_COMMENT, TINYXML\_UNKNOWN, TINYXML\_TEXT, and TINYXML\_DECLARATION.

**4.15.3.15** `const char* TiXmlNode::Value ( ) const [inline]`

The meaning of 'value' changes for the specific type of [TiXmlNode](#).

```
Document: filename of the xml file
Element: name of the element
Comment: the comment text
Unknown: the tag contents
Text: the text string
```

The subclasses will wrap this function.

- const char \* [CStr](#) ()  
*Return the result.*
- size\_t [Size](#) ()  
*Return the length of the result string.*

### 4.18.1 Detailed Description

Print to memory functionality. The [TiXmlPrinter](#) is useful when you need to:

1. Print to memory (especially in non-STL mode)

## 2. Control formatting (line endings, etc.)

When constructed, the [TiXmlPrinter](#) is in its default "pretty printing" mode. Before calling `Accept()` you can call methods to control the printing of the XML document. After [TiXmlNode::Accept\(\)](#) is called, the printed document can be accessed via the [CStr\(\)](#), [Str\(\)](#), and [Size\(\)](#) methods.

[TiXmlPrinter](#) uses the Visitor API.

```
TiXmlPrinter printer;
printer.SetIndent( "\t" );

doc.Accept( &printer );
fprintf( stdout, "%s", printer.CStr() );
```

### 4.18.2 Member Function Documentation

#### 4.18.2.1 void TiXmlPrinter::SetIndent( const char \* *\_indent* ) [inline]

Set the indent characters for printing. By default 4 spaces but tab () is also useful, or null/empty string for no indentation.

#### 4.18.2.2 void TiXmlPrinter::SetLineBreak( const char \* *\_lineBreak* ) [inline]

Set the line breaking string. By default set to newline ( `\n` ). Some operating systems prefer other characters, or can be set to the null/empty string for no indentation.

#### 4.18.2.3 void TiXmlPrinter::SetStreamPrinting( ) [inline]

Switch over to "stream printing" which is the most dense formatting without linebreaks. Common when the XML is needed for network transmission.

The documentation for this class was generated from the following files:

- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.h`
- `/home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp`

- bool **Blank** () const

### Friends

- class [TiXmlElement](#)

### 4.20.1 Detailed Description

XML text. A text node can have 2 ways to output the next. "normal" output and CDATA. It will default to the mode it was parsed from the XML file and you generally want to leave it alone, but you can change the output mode with [SetCDATA\(\)](#) and query it with [CDATA\(\)](#).

### 4.20.2 Constructor & Destructor Documentation

#### 4.20.2.1 TiXmlText::TiXmlText ( const char \* *initValue* ) [inline]

Constructor for text element. By default, it is treated as normal, encoded text. If you want it be output as a CDATA text element, set the parameter `_cdata` to 'true'

### 4.20.3 Member Function Documentation

#### 4.20.3.1 bool TiXmlText::Accept ( TiXmlVisitor \* *content* ) const [virtual]

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

#### 4.20.3.2 void TiXmlText::Print ( FILE \* *cfile*, int *depth* ) const [virtual]

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, `std::string` in STL mode.) Either or both `cfile` and `str` can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the `<<` operator.)

Implements [TiXmlBase](#).

The documentation for this class was generated from the following files:

- /home/cshome/m/mabrams/345/txtEngine/tinyxml.h
- /home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp
- /home/cshome/m/mabrams/345/txtEngine/tinyxmlparser.cpp

## 4.21 TiXmlUnknown Class Reference

```
#include <tinyxml.h>
```

Inheritance diagram for TiXmlUnknown:

### Public Member Functions

- **TiXmlUnknown** (const [TiXmlUnknown](#) &copy)
- [TiXmlUnknown](#) & **operator=** (const [TiXmlUnknown](#) &copy)
- virtual [TiXmlNode](#) \* **Clone** () const  
*Creates a copy of this Unknown and returns it.*
- virtual void **Print** (FILE \*cfile, int depth) const
- virtual const char \* **Parse** (const char \*p, [TiXmlParsingData](#) \*data, TiXmlEncoding encoding)
- virtual const [TiXmlUnknown](#) \* **ToUnknown** () const  
*Cast to a more defined type. Will return null not of the requested type.*
- virtual [TiXmlUnknown](#) \* **ToUnknown** ()  
*Cast to a more defined type. Will return null not of the requested type.*
- virtual bool **Accept** ([TiXmlVisitor](#) \*content) const

### Protected Member Functions

- void **CopyTo** ([TiXmlUnknown](#) \*target) const

#### 4.21.1 Detailed Description

Any tag that tinyXml doesn't recognize is saved as an unknown. It is a tag of text, but should not be modified. It will be written back to the XML, unchanged, when the file is saved.

DTD tags get thrown into TiXmlUnknowns.

#### 4.21.2 Member Function Documentation

##### 4.21.2.1 bool TiXmlUnknown::Accept ( [TiXmlVisitor](#) \* *content* ) const [virtual]

Walk the XML tree visiting this node and all of its children.

Implements [TiXmlNode](#).

4.21.2.2 void TiXmlUnknown::Print ( FILE \* *cfile*, int *depth* ) const [virtual]

All TinyXml classes can print themselves to a filestream or the string class ([TiXmlString](#) in non-STL mode, std::string in STL mode.) Either or both cfile and str can be null.

This is a formatted print, and will insert tabs and newlines.

(For an unformatted stream, use the << operator.)

Implements [TiXmlBase](#).

The documentation for this class was generated from the following files:

- /home/cshome/m/mabrams/345/txtEngine/tinyxml.h
- /home/cshome/m/mabrams/345/txtEngine/tinyxml.cpp

- virtual bool [Visit](#) (const [TiXmlComment](#) &)  
*Visit a comment node.*
- virtual bool [Visit](#) (const [TiXmlUnknown](#) &)  
*Visit an unknown node.*

### 4.22.1 Detailed Description

Implements the interface to the "Visitor pattern" (see the `Accept()` method.) If you call the `Accept()` method, it requires being passed a [TiXmlVisitor](#) class to handle callbacks. For nodes that contain other nodes (Document, Element) you will get called with a `VisitEnter/VisitExit` pair. Nodes that are always leaves are simply called with `Visit()`.

If you return 'true' from a Visit method, recursive parsing will continue. If you return false, **no children of this node or its siblings** will be Visited.

All flavors of Visit methods have a default implementation that returns 'true' (continue visiting). You need to only override methods that are interesting to you.

Generally `Accept()` is called on the [TiXmlDocument](#), although all nodes support Visiting.

You should never change the document from a callback.
